Chapter 1

Introduction

1.1 Disclaimer

As this is the Dumbified Version, much of the language in these notes may be worded very stupidly—at a fifth grade level even. This is because whenever I’m taking notes, I have to break it down to the dumbest level or I won’t understand it. The information may very well be wrong as well, so be sure to stay locked in when taking notes.

1.2 Class Description

From what it seems like, the class is about the methods and sciences behind making projects (software development). In DSA, you learned about many singular concepts (e.g., trees and simple algorithms), but those mean nothing if you can’t apply them. So, the goal of SDE is to allow you apply those concepts to real-life software.
